

LAB NAME : AI ASSISTED CODING
ROLL NO :2503A51L16
BRANCH : CSE
NAME : K. JASHUVA

TASK 1

Task Description: Use AI to generate test cases for a function `is_prime(n)` and then implement the function.

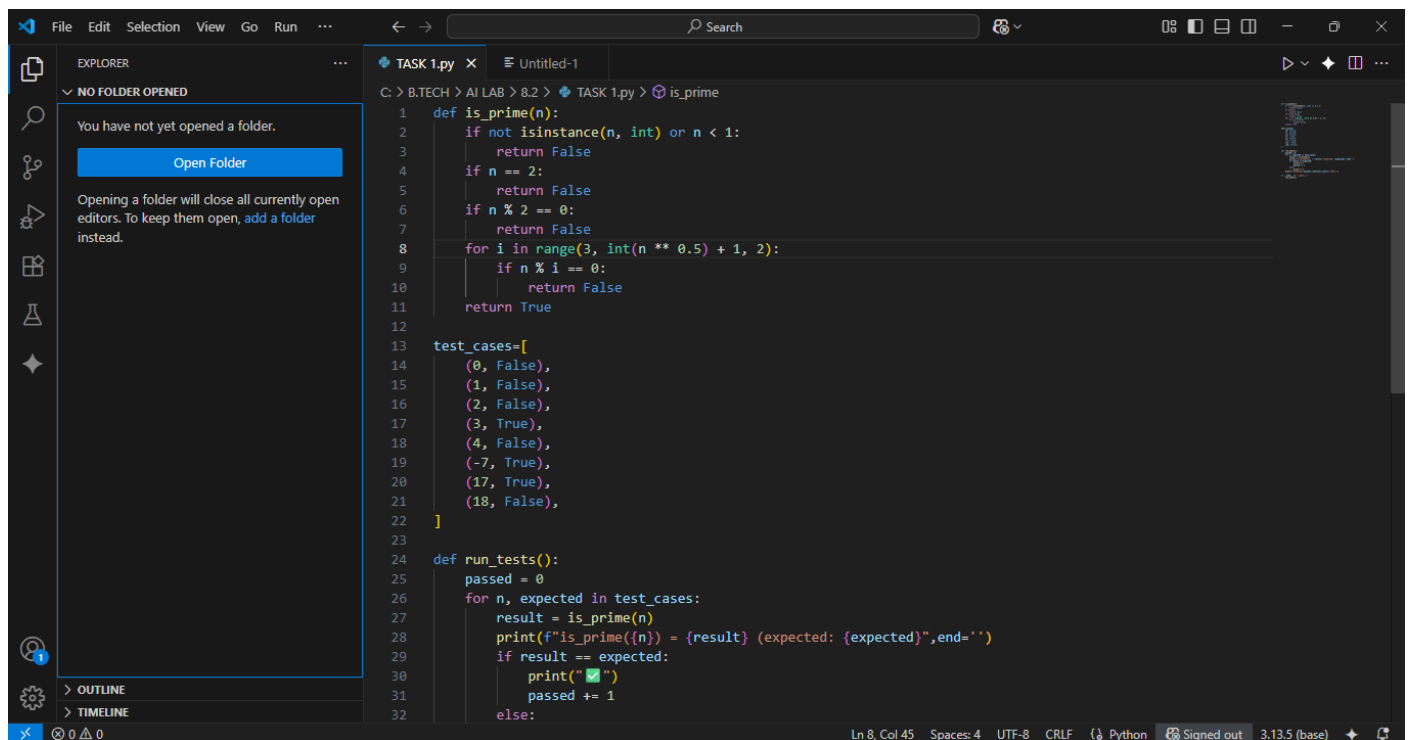

Requirements:

- Only integers > 1 can be prime.
- Check edge cases: 0, 1, 2, negative numbers, and large primes.

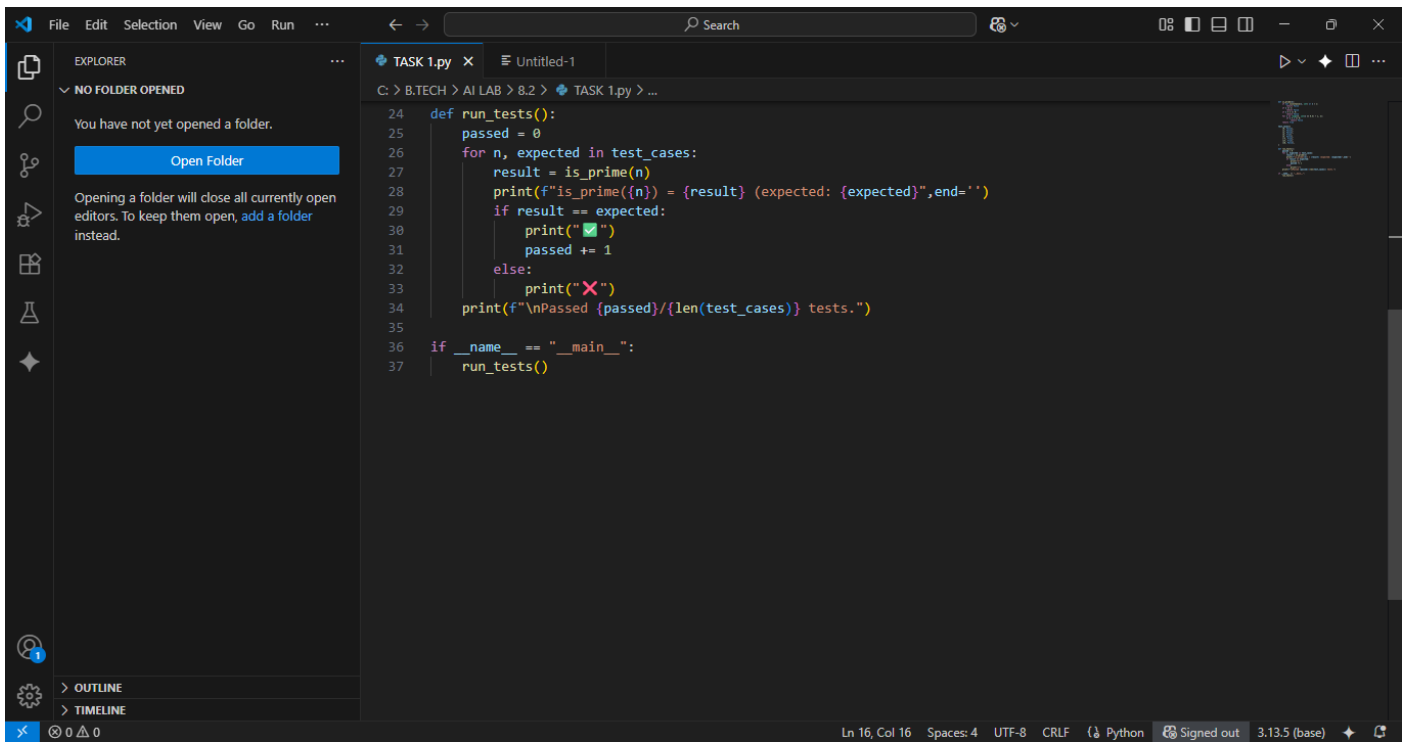

PROMPT:

Please write a Python function `is_prime(n)` and a corresponding suite of test cases to validate it. The function should be implemented first, followed by the tests.

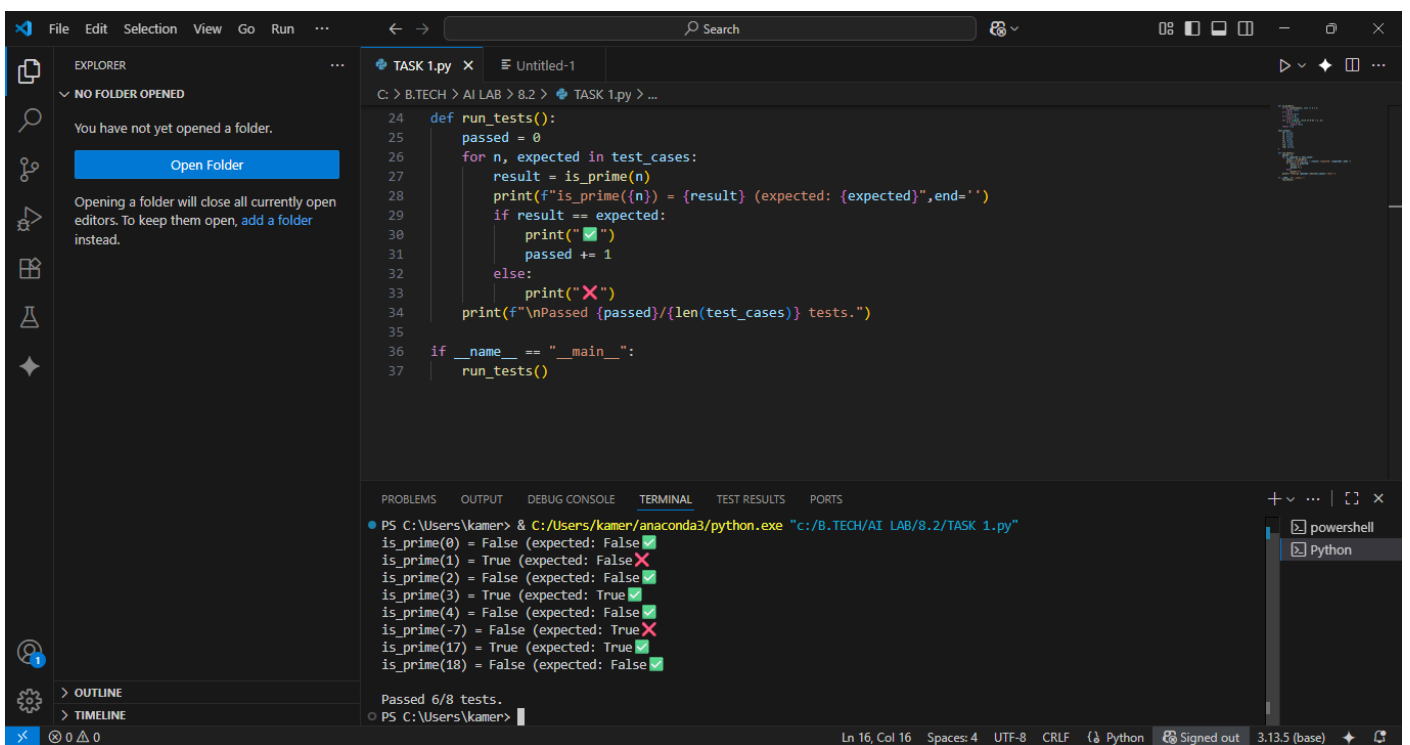

CODE:

```
1 def is_prime(n):
2     if not isinstance(n, int) or n < 1:
3         return False
4     if n == 2:
5         return True
6     if n % 2 == 0:
7         return False
8     for i in range(3, int(n ** 0.5) + 1, 2):
9         if n % i == 0:
10            return False
11    return True
12
13 test_cases=[
14     (0, False),
15     (1, False),
16     (2, False),
17     (3, True),
18     (4, False),
19     (-7, True),
20     (17, True),
21     (18, False),
22 ]
23
24 def run_tests():
25     passed = 0
26     for n, expected in test_cases:
27         result = is_prime(n)
28         print(f"is_prime({n}) = {result} (expected: {expected})",end='')
29         if result == expected:
30             print("✅")
31             passed += 1
32     else:
33         print("❌")
```

OUTPUT:

TASK 2

Task Description: Ask AI to generate test cases for `celsius_to_fahrenheit(c)` and `fahrenheit_to_celsius(f)`.

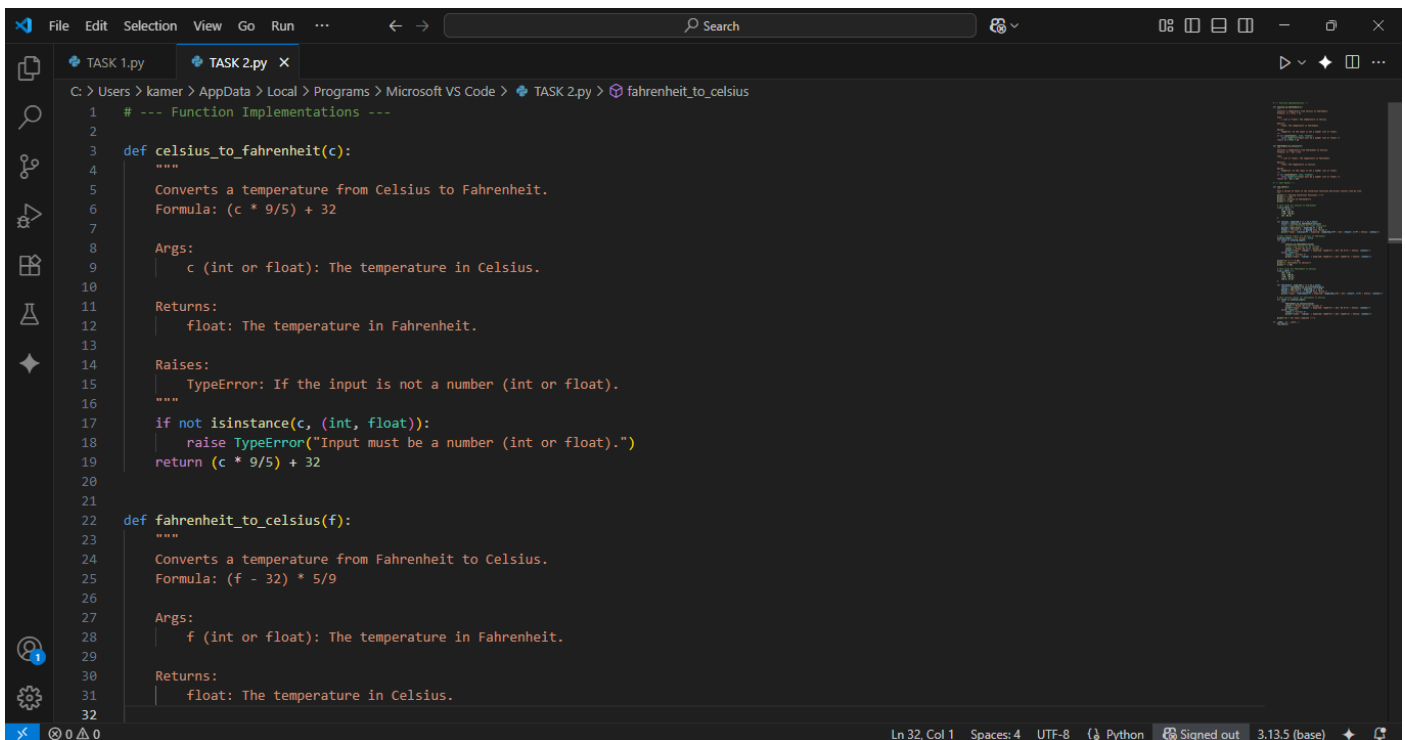

Requirements:

- Validate known pairs: $0^{\circ}\text{C} = 32^{\circ}\text{F}$, $100^{\circ}\text{C} = 212^{\circ}\text{F}$.
- Include decimals and invalid inputs like strings or None.

PROMPT:

Please write two Python functions for temperature conversion, `celsius_to_fahrenheit(c)` and `fahrenheit_to_celsius(f)`, and a corresponding suite of test cases to validate them.

CODE:

```
1  # --- Function Implementations ---
2
3  def celsius_to_fahrenheit(c):
4      """
5      Converts a temperature from Celsius to Fahrenheit.
6      Formula: (c * 9/5) + 32
7
8      Args:
9      | c (int or float): The temperature in Celsius.
10
11     Returns:
12     | float: The temperature in Fahrenheit.
13
14     Raises:
15     | TypeError: If the input is not a number (int or float).
16     """
17     if not isinstance(c, (int, float)):
18         raise TypeError("Input must be a number (int or float).")
19     return (c * 9/5) + 32
20
21
22 def fahrenheit_to_celsius(f):
23     """
24     Converts a temperature from Fahrenheit to Celsius.
25     Formula: (f - 32) * 5/9
26
27     Args:
28     | f (int or float): The temperature in Fahrenheit.
29
30     Returns:
31     | float: The temperature in Celsius.
32
33     """
34     return (f - 32) * 5/9
35
36
37 # --- Test Cases ---
38
39 def test_celsius_to_fahrenheit():
40     """Test cases for celsius_to_fahrenheit function"""
41     # Known pairs
42     assert celsius_to_fahrenheit(0) == 32
43     assert celsius_to_fahrenheit(100) == 212
44     # Decimals
45     assert celsius_to_fahrenheit(37.5) == 99.5
46     # Invalid inputs
47     assert celsius_to_fahrenheit("100") is None
48     assert celsius_to_fahrenheit(None) is None
49
50
51 def test_fahrenheit_to_celsius():
52     """Test cases for fahrenheit_to_celsius function"""
53     # Known pairs
54     assert fahrenheit_to_celsius(32) == 0
55     assert fahrenheit_to_celsius(212) == 100
56     # Decimals
57     assert fahrenheit_to_celsius(99.5) == 37.5
58     # Invalid inputs
59     assert fahrenheit_to_celsius("100") is None
60     assert fahrenheit_to_celsius(None) is None
61
62
63 if __name__ == "__main__":
64     test_celsius_to_fahrenheit()
65     test_fahrenheit_to_celsius()
```

The screenshot shows a Visual Studio Code editor window with a dark theme. The top menu bar includes File, Edit, Selection, View, Go, Run, and a search icon. The left sidebar contains icons for Explorer, Search, Source Control, Run and Debug, and Extensions. The main editor area displays a Python file named TASK 2.py. The code defines a function fahrenheit_to_celsius(f) that raises a TypeError if the input is not a number, and a test runner function run_tests() that tests the conversion function with various inputs. The status bar at the bottom shows 'Ln 32, Col 1', 'Spaces: 4', 'UTF-8', 'Python', 'Signed out', and '3.13.5 (base)'.

```

22 def fahrenheit_to_celsius(f):
23     Raises:
24         TypeError: If the input is not a number (int or float).
25     """
26     if not isinstance(f, (int, float)):
27         raise TypeError("Input must be a number (int or float).")
28     return (f - 32) * 5/9
29
30 # --- Test Runner ---
31
32 def run_tests():
33     """
34     Runs a series of tests on the conversion functions and prints results line by line.
35     """
36     print("--- Testing Conversion Functions ---")
37     print("-" * 35)
38     print("1. Celsius to Fahrenheit")
39     print("-" * 35)
40
41     # Test cases for Celsius to Fahrenheit
42     c_to_f_tests = [
43         (0, 32.0),
44         (100, 212.0),
45         (-40, -40.0),
46         (37, 98.6)
47     ]
48
49     for celsius, expected_f in c_to_f_tests:
50         result = celsius_to_fahrenheit(celsius)
51         # Use a small tolerance for float comparison
52         passed = abs(result - expected_f) < 1e-9
53         status = "Correct" if passed else "Wrong"

```

The screenshot shows a VS Code editor with a Python file named `task2.py`. The code is a test script for a `celsius_to_fahrenheit` function. It includes a `run_tests()` function that tests the conversion function with various inputs. The test cases are as follows:

```
def run_tests():
    for celsius, expected_f in c_to_f_tests:
        result = celsius_to_fahrenheit(celsius)
        # Use a small tolerance for float comparison
        passed = abs(result - expected_f) < 1e-9
        status = "Correct" if passed else "Wrong"
        print(f"Input: {celsius}°C | Expected: {expected_f}°F | Got: {result:.2f}°F | Status: {status}")

    # Test invalid inputs for Celsius to Fahrenheit
    invalid_inputs = ["a string", None]
    for value in invalid_inputs:
        try:
            celsius_to_fahrenheit(value)
            # This line should not be reached
            status = "Wrong (No error raised)"
            print(f"Input: '{value}' | Expected: TypeError | Got: No Error | Status: {status}")
        except TypeError:
            status = "Correct"
            print(f"Input: '{value}' | Expected: TypeError | Got: TypeError | Status: {status}")

    print("\n" + "-" * 35)
    print("2. Fahrenheit to Celsius")
    print("-" * 35)

    # Test cases for Fahrenheit to Celsius
    f_to_c_tests = [
        (32, 0.0),
        (212, 100.0),
        (-40, -40.0),
        (98.6, 37.0)
    ]
```

The status bar at the bottom indicates the current line is 32, column 1, with 4 spaces, UTF-8 encoding, Python language, and a signed-out user. The version is 3.13.5 (base).

TASK 5

Task Description:

Generate test cases for `is_number_palindrome(num)`, which checks if an integer reads the same backward.

Examples:

121 → True

123 → False

0, negative numbers → handled gracefully.

PROMPT:

Please write a Python function `is_number_palindrome(num)` and a corresponding suite of test cases to validate it.

CODE:

```
